

CONSEQUENCES OF CLIMATE CHANGE

Is the global variation of Earth's climate. This variation is due to natural causes and human action. The aim of this is to look at the consequences of the climate change.

Generally, most of the consequences negatively affect the planet and living beings, for example:

- 
- Water contamination
 - Animal extinction
 - Great meteorological phenomena such as hurricanes, cyclones...
 - Sea level rise and global temperature rise, and more bad consequences.
- 

To sum up, to stop climate change we must take better care of the environment, recycling, reducing consumption and reusing; for example you can reduce the consumption of plastic, the plastic in addition to contaminating can also affect our health. That way, we can make our planet a better place.
